SON-MAK RX-4

SURFACE CORING RIG

ABOUT SON-MAK

SON-MAK, which was established by İzzettin TAVUKCU in Bursa in 1983, adopting as a principle high quality standards, customer satisfaction focusing oriented investments.

The company is among the leading and well-established companies in its sector with the principle mutual trust, development and success.

With years of experience, SON-MAK has been producing many a different kinds of drilling machines, which are used in its branch and in the sector with the aim of searching the mines on the surface or underground and also the development of the industrial raw materials.

Not only with its professional and expert staff but also with the produced exploration drilling rigs, drilling equipments, mud pumps and injection systems, the company address to the strategically important mining and energy sectors of the world.

SON-MAK, which is the leader of the sector, serves at the most reliable level for the exploration of oil-natural gas, geothermal resources, for the searching of ground water, for the evaluation of dam areas, for the improvement of tunnels, bridges, weak soils.

SON-MAK is a global manufacturer of the drilling machines in with its factory in 14.500 sqm closed area.

SON-MAK, with its own brand name "LEVENT, constantly updating itself by following the new trends in the sector and always taking into consideration of the customer satisfaction higher, strives to produce new machines and equipment in the world standards by keeping up with the sustainable growth and with the high technology in its product range.

Analysis System of Core Barrel

1. OVERSHOT

The Overshot is dropped or pushed into the drill string to bring back the inner – tube assembly by means of wireline cable hoist.

2: LOCKING COUPLING

The Locking Coupling attaches the drill string to the outer – tube assembly and maintain a mating surface which the head assembly latches ride against while performing the drilling.

Besides this, locking couplings maintains directional control for the core barrel assembly by means of wear resistant preserving pads that wear down against the drill hole wall.

3: ADAPTER COUPLING

The adapter coupling matches between the locking coupling and core barrel outer – tube, maintaining the pocket into which the head assembly secures deploy.

4: HEAD ASSEMBLY

The head assembly maintains latching and also evoking spearpoint mechanism to grant insertion and bringing back of the inner – tube assembly, a bearing assembly to let on the inner – tube to remain stationary and avert sample damage while drilling, fluid pressure operating indications and fluid control valves. All head assemblies integrate a shut off valve assembly which maintains a fluid pressure signal to drill operator, revealing a full or blocked inner – tube.

5: LANDING RING

The Landing Ring sits in the upper – end of the outer tube and is recollected by the mating coupling. As the inner tube assembly trips into drill string the landing shoulder on the Head Assembly collides the Landing Ring setting the inner tube assembly into drilling position.

6. OUTER-TUBE

The outer – tube dwells the inner – tube assembly and connects to the diamond products piercing the hole. The increased wall thickness of the outer – tube maintains supplementary rigidity for directional control and a tighter hole annulus for increased fluid velocity and swift cuttings discharging for bit performance. Multiple outer – tubes can be assembled to extend the potential core sample lenght.

7. INNER-TUBE

The inner- tube takes the core sample as performing the drilling progresses. Multiple inner – tubes can be assembled with couplers or extensions to get longer core samples.

8. INNER-TUBE STABILIZER

Installed in the reaming Shell or in mated outer – tube extensions, the replaceable and reversible inner – tube stabilizer maintains centralizing for advanced sample recovery and a bearing between the stationary inner – tube and the rotating outer – tube.

9. CORE LIFTER

The core lifter is a pressed steel, split collar with a tapered body that matches to a tapered socket in the core lifter case.

In a core breaking operation, the drill string is climbed off bottom and the core sample starts to slide out of the inner – tube. Grip marks on the inner surface of the core lifter takes the moving core sample and pull the core lifter towards the smaller end of the tapered socket in the core lifter case. The core lifter is compressed against core sample and retainsit after it has broken, granting retrieval to surface.

10. CORE LIFTER CASE

The core lifter case mates to the inner-tube and houses the core lifter in a tapered socket which controls movement of the core lifter. As the drill string is lifted during a core breaking operation, the core lifter case bottoms out on the inside of the drill bit transferring the pullback load from the drill string to the core lifter until the core sample breaks.

11. STOP RING

The stop ring is a compressed steel snap ring devised to seat into a mating groove, and maintaining the core lifter in the core lifter case.

Wireline System

Wireline systems are optimal for use in most drilling conditions and applicable in standard DCDMA hole sizes. (B,N,H,P)

Son-Mak presently offers two models of the wireline core barrel system:

O / O 3

O wireline systems, includes the core barrel assembly and the overshot assembly. Both assemblies are essential to the wireline system.

The core barrel assembly is formed by the inner-tube assembly and outer-tube assembly.

The inner-tube assembly is formed:

- Head assembly
- Inner-tube
- Core lifter case
- Core lifter
- Stop ring

The inner-tube assembly takes the core sample during the performing of the drilling process and separate of the outer-tube assembly.

The outer-tube assembly is formed by the remainder of the core barrels components:

- Locking Coupling
- Adapter Coupling
- Outer-tube

The outer tube assembly always stands at the bottom of the hole and dwells the inner-tube assembly during the drilling process.

O 3

O3 Wireline systems contains the same assemblies as the O but utilize a third tube called an inner-tube liner or split tube. The liner is housed inside the inner-tube.

O3 systems implements integral core recovery when drilling, clay bearing coal or highly fractured formations. The liner, or split tube, contains the core sample in its received state for easier loading into sample trays or for storage and following presentations to the geologist. The O3 system is only applicable in surface configurations and is possible in N Wireline, H Wireline and P Wireline sizes.

Diameters

O (Standard)				
SIZE	CORE DIAMETER		HOLE DIAMETER	
	Metric (mm)	U.S. (in)	Metric (mm)	U.S. (in)

CORE BARRELS STRUCTURES, FEATURES AND CHOICES

Overview of Structure

Within the Core Barrel Assemblies options of this catalog, both core barrel assemblies and inner – tube teams are referred. Both assemblies are separately configurable and incorporate a specific set of components as outlined below.

Core Barrel Assemblies

The Core Barrel Kits include all elements needed to perform a full core barrel and use it within a rod string:

- Head Assembly
- Inner – Tube
- Stop ring
- Core Lifter
- Core Lifter Case
- Locking Coupling
- Adapter Coupling
- Landing ring
- Outer – tube
- Inner – Tube stabilizer

Inner – tube assemblies

Inner – tube assemblies enable the necessary elements to get a core sample from head assembly to core lifter:

- Head Assembly
- Inner – Tube
- Stop Ring
- Core Lifter
- Core Lifter Case

Wireline Core Barrel Assemblies

Wireline core barrels, inner tube and inner tube assembly in particular constitute the most important part of these sets. Both ends of the inner tubes are made of male threaded cold-drawn steel tubes. The types of threads at both ends are the same. Since the part where the core is inserted will be eroded faster than the top section, use of the tube by turning upside down from time to time will extend its service life.

8

The core lifter case where the core lifter (see 8) is inserted is located at the bottom side of the inner tube. There is a case inside the core lifter and just above the part where the core lifter is inserted and the core lifter can be placed there (see 10). This ring prevents the core lifter to be dragged into the inner tube together with the core.

The inner tube assembly is located at the top of the inner tube.

This assembly is the most important part of wireline system and it includes some systems. When inner tube is inserted into the outer tube, the latches on the inner tube assembly are opened by link affect and are inserted inside the housing on the head of the outer tube. Therefore, the inner tube is prevented to retrocede during progress.

At the end of the progress, when spear head located at the top of the assembly is held and dragged by the overshot, latches retract and close so that the inner tube is released to a free position where it can pass through the rods and be taken upwards.

DIAMOND PRODUCTS

Impregnated Bits

Eagle impregnated diamond bits are the most widely used impregnated diamond bits in the core drilling operations by adjusting the combination of metal powders and diamonds in the matrix.

68

Eagle impregnated diamond bits can be manufactured to maximize penetration rates and bit life in a variety of rock formations.

As drilling progresses, the crown is slowly worn away exposing new diamonds on the cutting surface. When the wear rate between the matrix material and the diamonds is balanced, optimum penetration rates and bit life will be achieved.

Eagle Bits are offered as a non-customizable design with a standard crown height and waterways.

Eagle Bits offer a great combination of quality and value.

EAGLE DIAMOND BITS HARDNESS CHART

HARDER							
EXTREMELY ABRASIVE	SOFT - VERY ABRASIVE	SOFT - HIGHLY ABRASIVE	MEDIUM ABRASIVE	HARD ABRASIVE	HARD - MEDIUM ABRASIVE	VERY HARD ABRASIVE	LOW ABRASIVE
Soapstone	Gypsum	Calcite	Fluorite	Apatite	Feldspar	Quartzite	Taconite
Talc	Shale	Dolomite	Limestone	Pegmatite	Diorite	Gneiss	Banded Iron
Coal	Loose Sandstone	Claystone	Serpentine	Dolomitic Limestone	Granite	Rhyolite	Corundum
Tuff	Siltstone	Salt	Sandstone	Volcanic Sandstone	Dolomite	Diorite	Conglomerate
Chalk	Amber	Soft Schist	Hard Shale	Schist	Hematite	Basalt	Sapphire
1	2	3	4	5	6	7	8
9							

EAGLE 1/2
Hardness: 1 - 4.5

EAGLE 3/4
Hardness: 2.5 - 6

EAGLE 5/6
Hardness: 4.5 - 7.5

EAGLE 7/8
Hardness: 6 - 8.5

EAGLE 9/10
Hardness: 7 - 9

EAGLE 11/12
Hardness: 7.5 - 9

Eagle Bit's are typically designated by series. Each series is designed to work under specific condions of ground hardness and abrasiveness.
Please refer to the selection table to identify the appropriate series for your drilling conditions.
Eagle Bits are offered as a non-customizable design with a standard crown height and waterways.
Eagle Bits offer a great combination of quality and value.

SERIES 1/2

Eagle 1/2 is made with an extremely wear resistant matrix for long life in soft formations, but can also be used in medium broken formations.

SERIES 3/4

Eagle 3/4 is a good choice for cutting soft to medium formations.
Recommended for low powered drills only. High loads will seriously reduce bit life.

SERIES 5/6

Eagle 5/6 is a general purpose formula for cutting formations in the medium hard range. 5/6 also works well in formations of variable hardness.

SERIES 7/8

Eagle 7/8 Series is a general purpose bit for cutting hard formations. For hard competent and nonabrasive formations. This free cutting bit requires high rotational speeds and light bit loads for best performance.

SERIES 9/10

Eagle 9/10 is made to cut ultra hard fine grain formations. This is an alternative when drilling very hard formations with a low torque drill rig.

SERIES 11/12

Eagle 11/12 is made to cut ultra hard fine grain formations. This is an alternative when drilling ultra hard formations with a low torque drill rig.

Waterway Configurations

STANDARD WATERWAYS(S)

Standard waterways are recommended for most general purpose coring operations and off great fluid circulation in a variety of conditions.

TURBO(T)

SON-MAK Turbo Bits waterways provide increased flushing ability and lessen the contact area of the bit to the rock, therefore giving the bit more cutting ability with less pressure. This allows for reduced torque and increased penetration rate. Only available in impregnated diamond bits.

TAPERED WATERWAYS(TW)

Recommended for soft and broken formations when standard waterways may become blocked. The taper flushes cuttings to help keep the waterways clear.

FACE DISCHARGE(FD)

Recommended for very soft and broken formations or when using Triple-tube (03) barrels SON-MAK Face Discharge waterways increase flushing characteristics to prevent waterway blockage by ejecting fluid through ports molded into the face of the bit.

DEEP I.D.WATERWAYS(DD)

Designed to maximize the waterway depth on the I.D. of the bit, which reduces the jetting or washing away of the core. The extra clearance minimizes the vacuum effect caused by the water flow past the lifter case in a lost circulation application.

SPIRAL(SP)

Recommended for drilling in broken formations. Specifically angled waterways allow for greater fluid ejection.

1. Crown: Available in a wide variety of formations. The crown is the cutting edge of the bit.

2. Tungsten Carbide: Protect stability of the crown.

3. Core Lifter Case Seat: Supports core lifter case when breaking core.

4. Bitthreads: Precision cut industry standard bit threads.

5. Bit Body: Made of superior quality steel and machined in small batches to maintain manufacturing standards.

6. Waterways: Controls fluid flow around the cutting edge of the bit.

7. Bit Face: Ideal design allows for quick startup of new bit.

Troubleshooting

NEW IMPREGNATED DIAMOND BIT

IDEAL WEAR

RETIREMENT IMPREGNATED DIAMOND BIT

81

FACE GLAZED

Sand blast face or use other recommended methods to re-expose diamond. Try again with rpi (r/cm) in the 200/250 (80/100) range. If the face glazes repeatedly, change to a higher bit.

CRACKED WATERWAYS

Possible Reasons:

- Excessive bit load; dropped rods; free fall of inner tube in dry hole
- Bit crushed by rod holder, foot clamp or pipe wrench
- Pushed down an undersized hole (i.e., reaming shell worn out).

BURNT

Possible Reasons:

- Lack of fluid.
- Too high of weight on bit being used.

Solutions

- Check pump and rod string for leaks, check inner tube adjustment, maintain coolant flow rates.

CONCAVE FACE WEAR

Possible Reasons:

- Often caused by excessive penetration rate for the rpm used - rpi (r/cm) too low.
- Also can be caused by core grinding, overdrilling.

Solutions

- Reduce penetration rate or increase RPM

CONVEX FACE WEAR

Possible Reasons:

- Insufficient water flow.

Solutions

- Check pump and rod string for leaks; increase pump output.

GAUGE LOSS ID

Possible Reasons:

- Overfeeding
- Broken formations
- Drilling over lost core
- Insufficient drilling fluid

Solutions

- Reduce penetration rate
- Cement or change to a lower series bit
- Check core barrel/core lifter/core lifter case
- Check inner tube length adjustment; check pump and rod string for leaks – increase pump output.

GAUGE LOSS OD

Possible Reasons:

- Lack of circulation
- Bit being reamed down under-size hole
- Vibration

Solutions

- Increase coolant flow rate
- Check reamer shell gauge and replace if under-sized
- Alter RPM

RODS AND CASINGS

Rods Thread Overview

84

O Thread

- High quality alloy steel tubing
- Wireline thread
- Easy make - break

RO Thread

- High quality alloy steel tubing
- Increased strength and wear life
- Upgrade over O wireline rod

HD Thread

- High quality alloy steel tubing
- Strong thread
- Large diameter drilling

WJ Thread

- High quality alloy steel tubing
- Standard DCDMA thread
- Friction welded

Casings Thread Overview

W Thread

- Standard DCDMA thread

WT Thread

- Premium over W Casing
- Compatible with HD rod threads.
- Easy make and break

Wireline Rods - BO
